# **Electric Power Grid of the Future**

#### CIGRE Next Generation Network March 4, 2020

#### **Rob Gramlich**

www.gridstrategiesllc.com

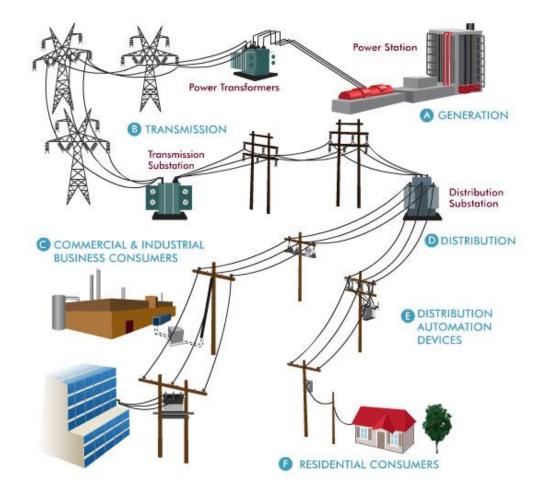

Grid History and Future with high penetration renewables

- 1. Traditional vertical industry structure
- 2. Need for regionalization
- 3. Need for a robust macro grid
- 4. Need for efficient transmission utilization
- 5. Need for large regional power markets
- 6. Reliability considerations
- 7. Hybrid resources

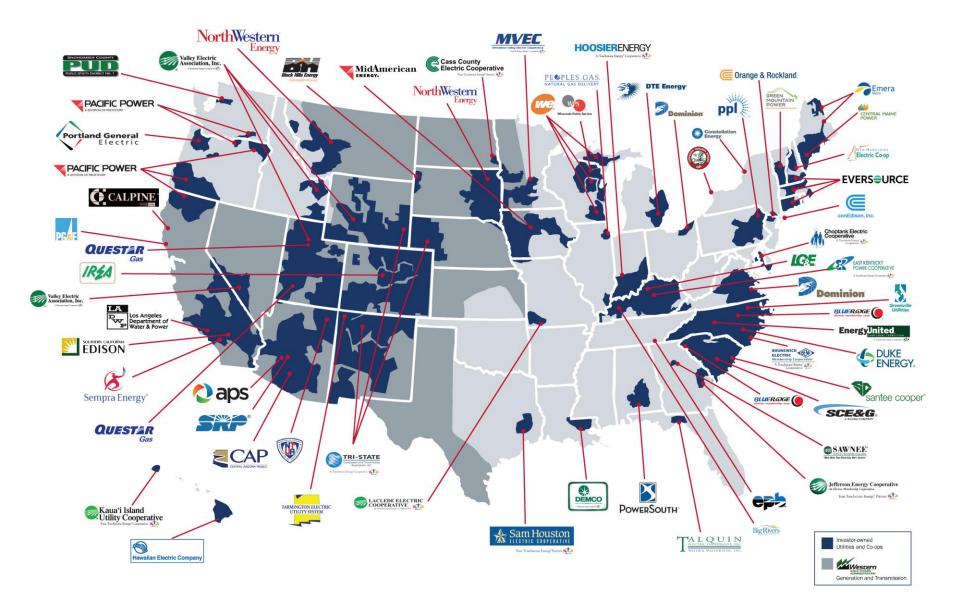

### Traditional vertically integrated utility structure

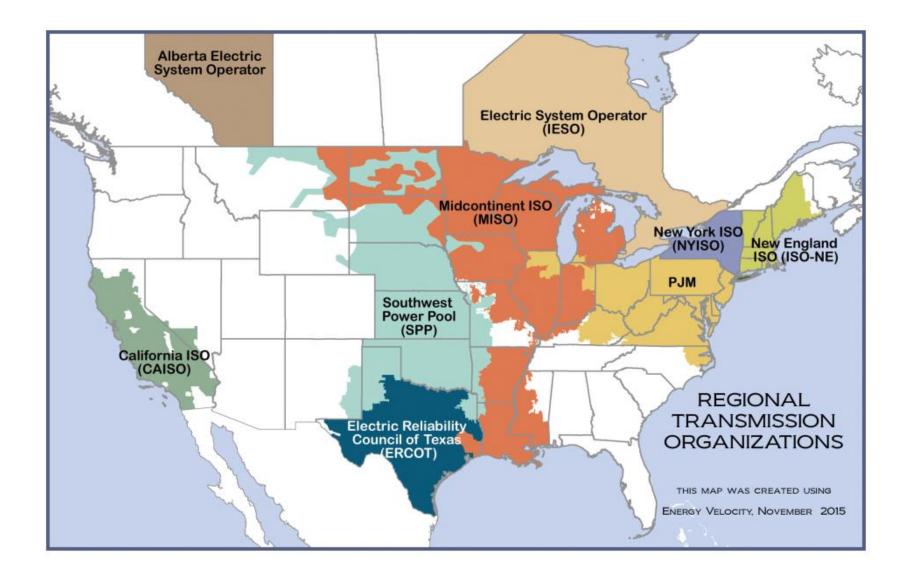

### **Traditional vertical utilities**

## **Regionalization with RTOs and ISOs**

# **RTO Characteristics and Functions**

(FERC Order 2000) (1999)

Characteristics:

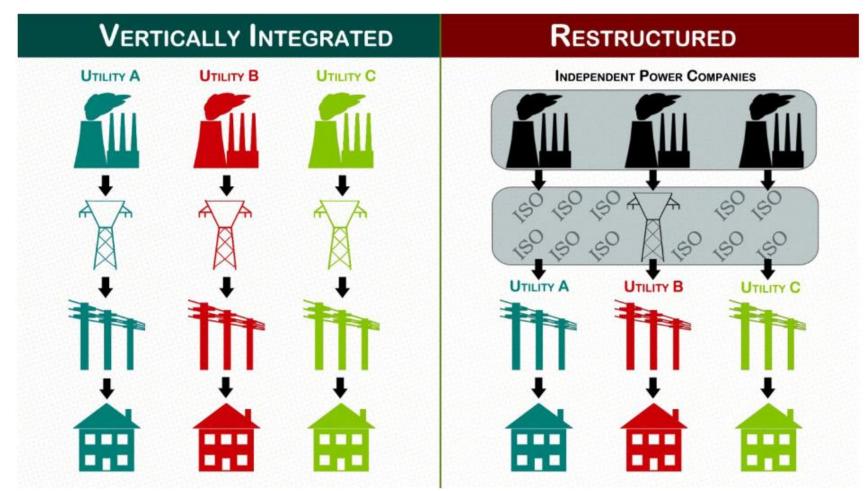

- 1. Independence
- 2. Scope and regional configuration
- 3. Operational authority
- 4. Responsibility for shortterm reliability.

#### Functions:

- 1. Administer and design tariffs
- 2. Manage congestion
- 3. Solve the parallel path flow problem
- 4. Manage and provide ancillary services
- 5. Maintain OASIS and post the transmission capability
- 6. Perform market monitoring
- 7. Plan and manage transmission system expansion
- 8. Handle interregional coordination.

## Wholesale Competition Structure

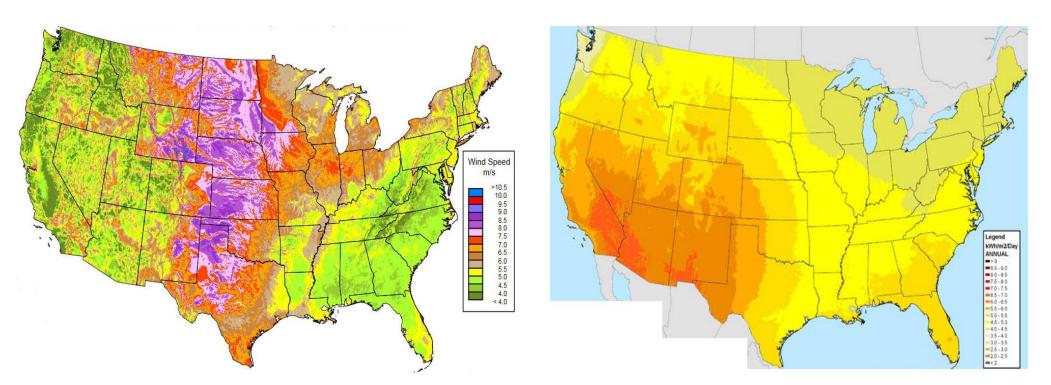

-Devin Harman https://www.rstreet.org/wp-content/uploads/2016/08/67.pdf

#### Transmission and Renewable Energy

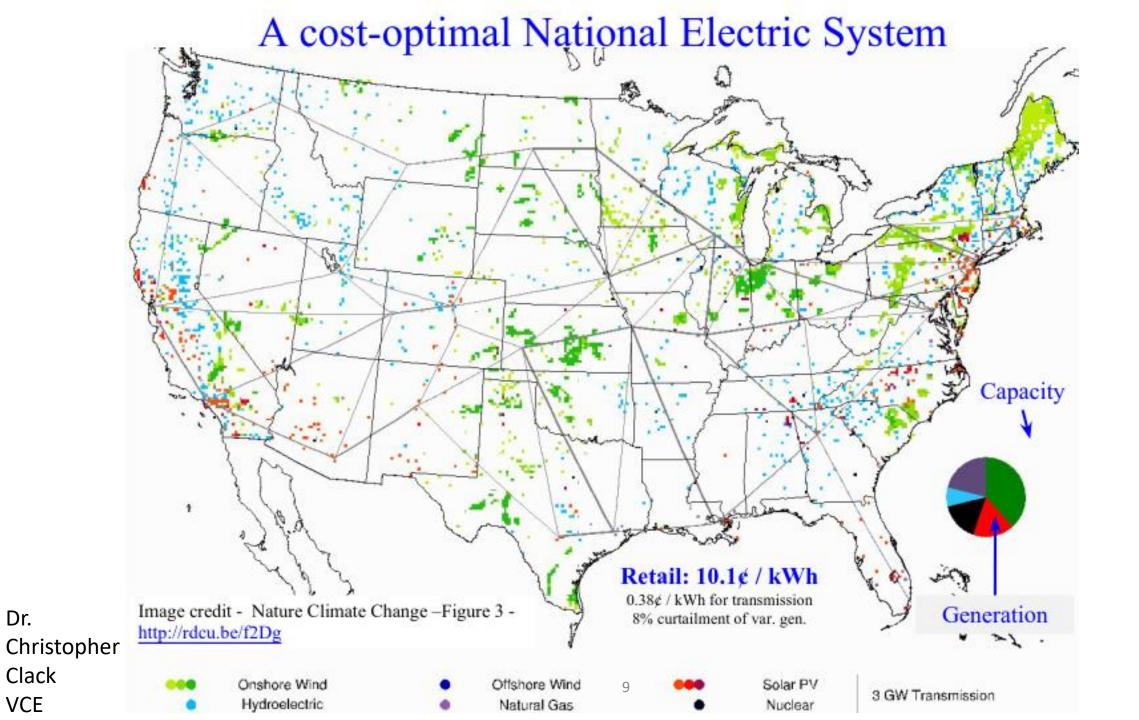

• Best wind and solar far from load

NREL Wind (left) and Solar (right) Resource Maps

# US Transmission Congestion Costs Rising (Again)

Transmission Congestion Costs (\$ millions) for RTOs from 2016-2018

| RTO    | 2016    | 2017    | 2018    |  |  |
|--------|---------|---------|---------|--|--|
| ERCOT  | 497     | 976     | 1,260   |  |  |
| ISO-NE | 38.9    | 41.4    | 64.5    |  |  |
| MISO   | 1,400   | 1,500   | 1,400   |  |  |
| NYISO  | 529     | 481     | 596     |  |  |
| PJM    | 1,023.7 | 697.6   | 1,310   |  |  |
| SPP    | 273.7   | 405.3   | 380.9   |  |  |
| Total  | 3,762.3 | 4,101.3 | 5,011.3 |  |  |

# First, Use the Existing Grid More Efficiently

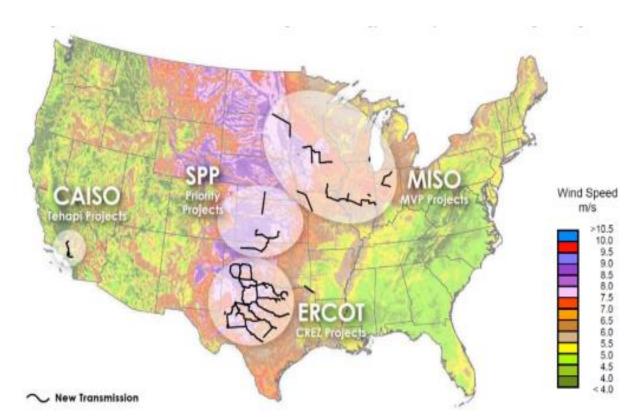

- Power Flow Control
  - Push and pull power, modular, scalable, movable
- Dynamic Line Ratings
  - Adjust path rating based on ambient conditions, allows capacity forecasting
- Topology Optimization
  - Software to optimize transmission assets, eg circuit breakers
- Storage as Transmission

Re-set incentives on transmission owners

## **Recent Large-Scale Expansions**

- MISO MVP, SPP priority projects, ERCOT CREZ
- 3:1 Benefit-Cost ratios
- Winning formula:
  - Pro-active multi-benefit planning
  - Broad, beneficiary pays allocation

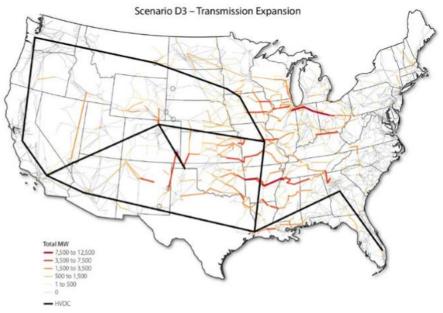

#### Transmission Enabled ½ of US Wind Capacity ~105 GW installed in US

| Transmission plan                            | Wind Capacity Enabled (GW) |
|--|----------------------------|
| Tehachapi                                    | 4.5                        |
| Texas CREZ                                   | 14.5                       |
| MISO MVP                                     | 14                         |
| SPP Priority Projects, Balanced<br>Portfolio | 6                          |
| CO+ME+NV+PAC+BPA                             | 10                         |
| Total  | 49                         |

## **Transmission Barrier 1: Permitting**

- State by state review
- States impacting other states, national interest not being considered

## **Transmission Barrier 2: Narrow planning**

- Almost no inter-regional plans have been produced
- Planning by RTOs has been ground-up rather than comprehensive
- Planning has not been pro-active to consider known generation development in resource areas
- Planning benefits have been compartmentalized: economic/reliability/resilience/generator interconnection

Broad regional and inter-regional multi-purpose planning

## **Transmission Barrier 3: Funding**

- FERC generator interconnection policy allowed "participant funding"
  - Even when many generators are connecting in the same area
- Not all benefits considered

#### Broad cost allocation

- Consider all benefits
- As they may change over time
- FERC assign costs to all beneficiaries

Investment Tax Credit

# Market Design for an Evolving Resource Mix

#### • <u>F</u>lexible

- Fast (eg, 5 minute) dispatch, price based on value
- Close to real time commitments and dispatch
- <u>F</u>air
  - Technology neutral—pay for DELIVERED SERVICES, not ATTRIBUTES
  - Small building blocks
- <u>F</u>ar
  - Large geographic areas with seamless trading
- <u>F</u>ree
  - Bilateral contracts uninhibited
  - Full demand side participation, all flavors

See https://windsolaralliance.org/wp-content/uploads/2018/11/WSA\_Market\_Reform\_report\_online.pdf

#### Wholesale Price Effects of 40-50% Wind & Solar

(Wind: 30% wind & 10+% solar | Faxon ed: 20% wind & 20% solar | Solar: 30% solar & 10+% wind)

| Impacts in 2030   | Southwest Power Pool<br>2016: 18% wind & 0% solar |                      |             | NYISO (New York)<br>2016: % wind & 1% solar |                       |       | CAISO (California)<br>2016: 7% wind % 14% solar |                   |       | ERCOT (Texas)<br>2016: 16% wind & 1% solar |                        |       |

## Best Market Structure for Low Cost De-Carbonization

- Environmental regulators internalize externalities
- <u>RTO/ISO</u> balances power system and administers short term spot markets
  - Procures energy and reliability services based on engineering definitions
  - Also plans transmission infrastructure for reliability and efficiency given future resource mix, recovers cost in regional tariff
- <u>Retail suppliers</u> competitively procure power (hedge) with PPAs to serve load
- <u>State PUCs</u> oversee hedging for some or all customers
  - ensure retail suppliers are credit-worthy buyers of wholesale power
  - Level playing field between retailers and provider of last resort
- <u>Utilities</u> build, own, and operate monopoly T&D (not G) with regulated rates
- <u>Independent Power Producers</u> build and own generation to sell electricity products to retail suppliers/wholesale buyers
- Financial participants provide risk management products

### Reliability Efforts with Generation being considered by NERC and RTOs

- Common mode failures affecting multiple generators that are getting credit for having uncorrelated outages
- Peak energy supply in Northeast/Midwest winter Polar Vortices
  - If gas and transmission import constraints
- Ride-through capability and settings on inverter-based technologies
- Stability in weak areas of the grid
- Inertia/Fast Frequency Response adequacy with declining amounts of synchronous generation

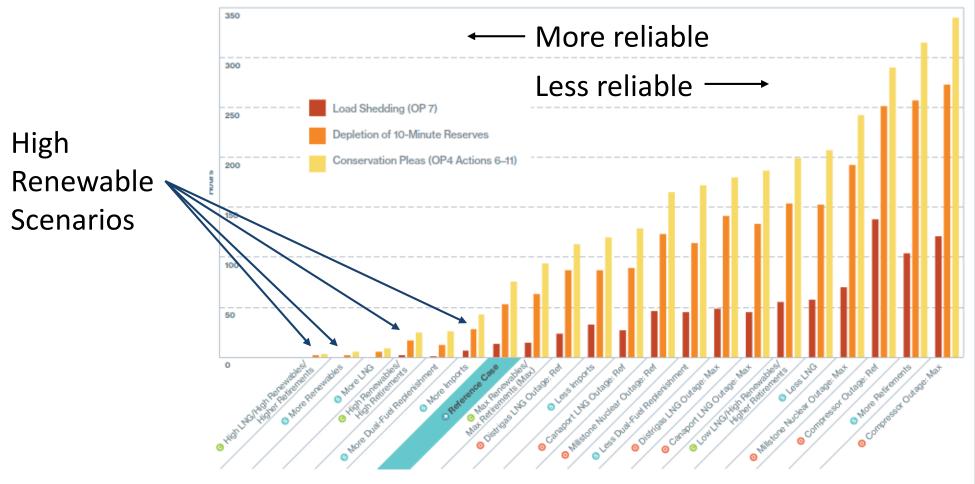

## **Reliability Services of Generation Sources**

|  | Inverter-Based |             |                     |       | Demand<br>Response |      |            |                    |
|--|----------------|-------------|---------------------|-------|--------------------|------|------------|--------------------|

#### WHOLESALE ELECTRICITY MARKET DESIGN FOR RAPID DECARBONIZATION: A DECENTRALIZED MARKETS APPROACH

#### BY ROB GRAMLICH<sup>2</sup> AND MICHAEL HOGAN<sup>2</sup> JUNE 2019

"What wholesole market design would provide the best framework for integrating reliably and at least cost the new, clean resources that will be needed to de-carbonize the power system?"

This common guestion includes what model best provides clean sources with fair access, what model best drives timely retirement of the fossil

generation these clean resources are meant to replace, and what role the wholesale market should play in enabling new "smart" resources at the distribution/retail level. The question also includes both market structure (which entities perform which functions) and market design (what are the trading, bidding, and price-setting rules).<sup>#</sup> The pace and scale of new investment in clean resources will be determined in part exogenously, by environmental legislation or regulations. Such public policy instruments, including zero-carbon portfolia standards or carbon cap-and-trade, should be designed to address the market externalities of greenhouse gas emissions. in a way that complements rather than substitutes for the rale of the market in driving investment.

The question above is often motivated by three concerns regarding the standard spot electricity market design that shaped most current organized wholesale energy markets:

<sup>a</sup> Grid Strategies LLC https://gridstrategies/kc.com/

<sup>2</sup> Regulatory Assistance Project https://www.raporline.org/

<sup>3</sup> The question does not address the substantial transmission infrastructure needs for a de-carbonized grid; this is a more difficult challenge that also must be addressed and involves a significant role for traditional planning.
