

IEEE Guide for Distribution Resiliency

Shikhar Pandey

IEEE Distribution Resiliency Taskforce Chair

Email: Shikhar.Pandey@gridcopartners.com

IEEE DRES Chapter Outline

The chapters aim to provide an understanding of resiliency, offer tools for utilities to study threats, quantify resilience metrics, and discuss system enhancements. It also includes case studies from five utilities across North America.

Executive summary Electric distribution grid reliability and resiliency Literature review Grid resilience goals and objectives System resilience assessment methods: modeling, simulation and analysis Resilience metric Resilience improvement – infrastructure, operations and technology solutions Case studies

Resilience Guide Outline

CHAPTER	LEAD	
CHAPTER 1: Literature Review	Masoud Davoudi	
CHAPTER 2: Resilience Goal / Objectives	John Lauletta	
CHAPTER 3: Quantification of Resiliency	Shikhar Pandey	
CHAPTER 4: System Modeling and Storm Simulation	Sarmad Hanif	
CHAPTER 5: Infrastructure and Operational Improvements for Resilience	Julio Romero	
CHAPTER 6: Case Study and Resiliency Study	Gary Huffman	

What is Resiliency?

What is Resiliency?

FERC has proposed that resilience means the "ability to withstand and reduce the magnitude and/or duration of disruptive

events, which includes the capability to anticipate, absorb, adapt to, and/or rapidly recover from such an event."

Credit: Utility Dive Feb 2, 2018 by Kate Konschnik and Brian Murray

Proposed IEEE Definition

The capability of electric power <u>distribution</u> systems to <u>deliver</u> electric energy to end-use customers by <u>avoiding interruptions</u>

and/or recovering this capability following exposure to naturally occurring high impact low frequency events.

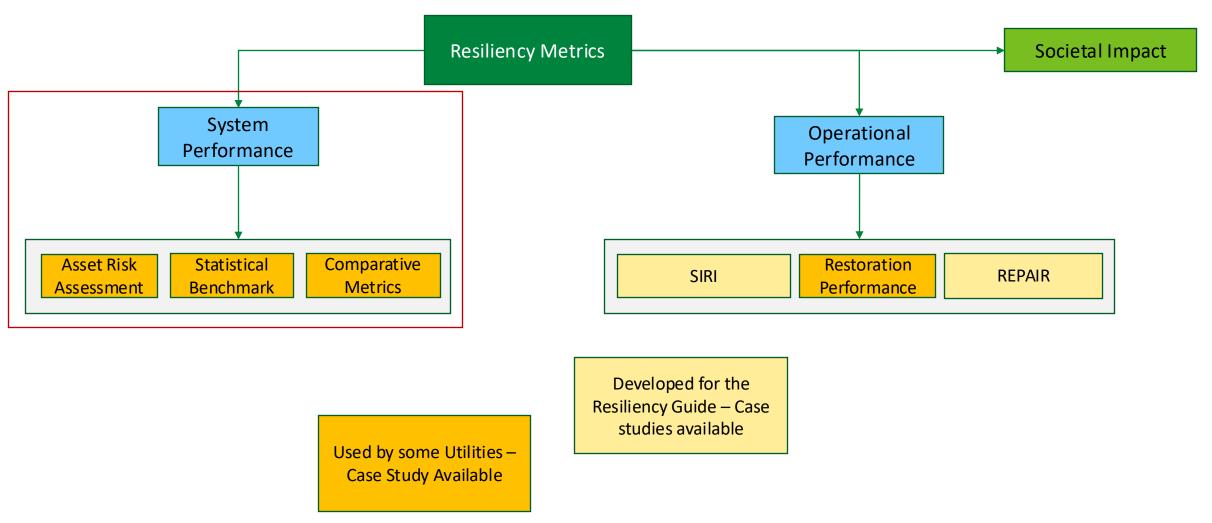

IEEE Distribution Resiliency Focus

Out of scope: BES, Cyber/Physical Security, Operational Events Primary Focus: Extreme Weather Events, Natural Phenomenon

A Comprehensive Suite of Metrics

Assets Risk Assessment

1. Climate Vulnerability Studies: Utilities are assessing risks from climate hazards to understand the impact on their assets.

Description	Temperature, Heat and Humidity	Flooding	Wind and Ice	Wildfire
Exposed Assets-At-Risk Properties	Thermal rating reduction, Accelerated asset degradation	Water-related equipment sensitivity, Corrosion, Soil Weakening	Wind and Ice Loading Tolerance, Vegetation Proximity	Fire-related equipment damage, Smoke on conductors, Soot accumulation over insulators, damaged insulators exhibiting high leakage currents, Vegetation Proximity

- 2. Asset-Risk Assessment Metric: Utilizes two matrices:
 - **Exposure Properties to Risk Matrix**: Identifies asset properties affected by climate change.
 - > Assets-to-Exposure Matrix: Prioritizes asset strengthening based on risk levels (medium, high, low) against climate change variables.

Equipment vs Threat	Temperature, Heat and Humidity	Flooding	Wind and Ice	Wildfire
Substation	High Risk	High Risk	Low Risk	Low Risk
Overhead Equipment	Medium Risk	Low Risk	High Risk	High Risk
Underground Equipment	High Risk	Medium Risk	Low Risk	Low Risk

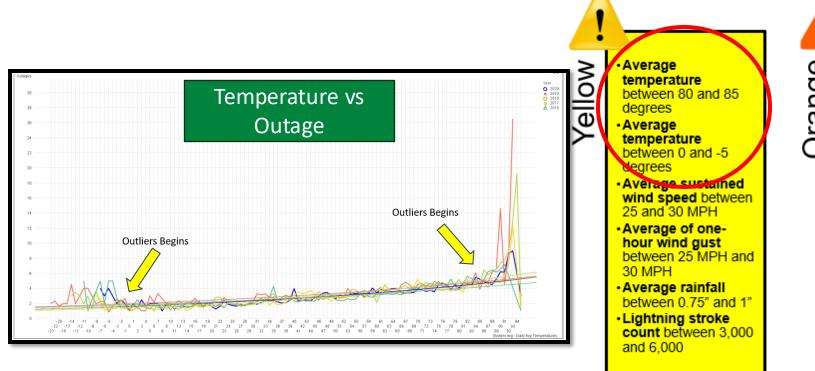

Gray Sky Day: Focuses on robustness and the ability to withstand most weather events

- We established a statistical benchmark based on weather parameters and historical outages
- This benchmark tracks the system performance (of outages) during gray sky days

Orange

- •Average temperature between 85 and 90 degrees
- •Average temperature between -5 and -10 degrees
- Average sustained wind speed between 30 and 35 MPH
- Average of onehour wind gust between 30 MPH and 35 MPH
- Average rainfall between 1" and 1.25"
- Lightning stroke count between 6,000 and 10,000

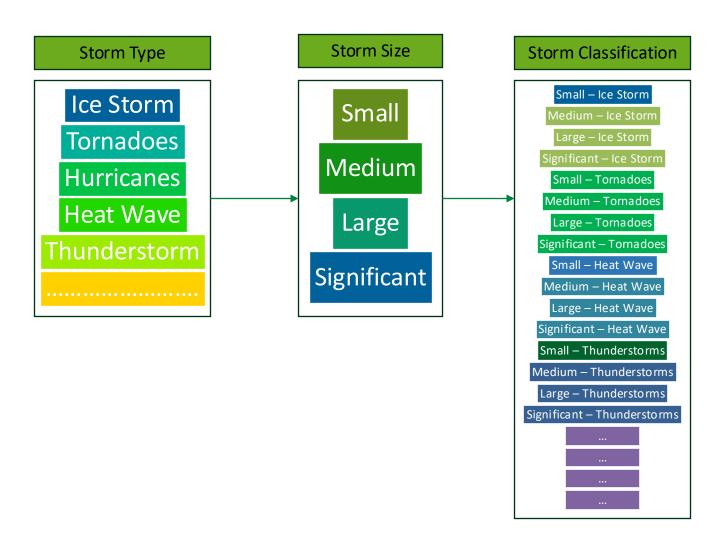

Sed

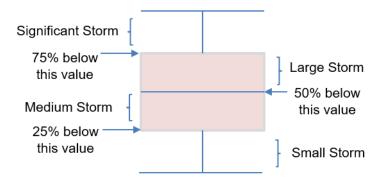

- Average temperature greater than 90 degrees
- Average temperature less than -10 degrees
- •Average sustained wind speed >= 35 MPH
- Average of onehour wind gust >= 30 MPH
- Average rainfall greater than 1.25"
- Lightning stroke count greater than 10,000

Storm Classification

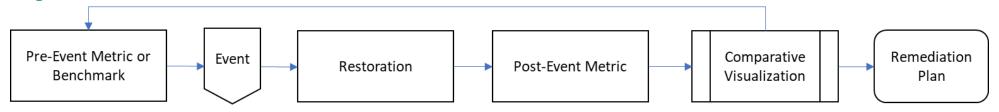

Comparative Metrics

Metric	Attributes	Historical Benchmark	Current Event Records	Performance Assessment
Storm Strength Comparison	Wind Speed	70 mph	80 mph	Increased wind speed, correlates with longer outages
	Precipitation	2 inches	3 inches	Higher precipitation, potential cause for disruptions
Flood Comparison –	Substation Outages due to Flood	5 incidents	3 incidents	Improved resilience, fewer outages
Substations/Underground Equipment	Underground Equipment Outages due to Flood	10 incidents	12 incidents	Slight increase, review flood mitigation strategies
Square Miles Impacted/Customer	Square Miles Impacted	50 sq miles	60 sq miles	Larger area impacted, reassess preparedness
Density	Customer Density	1,000 customers/sq mile	1,200 customers/sq mile	Higher density, more significant impact
Pole Damage Comparison	Pole Damage Incidents	15 incidents	20 incidents	Increased incidents, consider reinforcement strategies
Equipment Damage Comparisons	Equipment Damage Incidents	30 incidents	52 incidents	Increased incidents, proactive maintenance strategy
Construction Person Hours to	Construction Person Hours - Hardened	500 hours	450 hours	Improved efficiency, hardening measures effective
Restore Hardened vs. Non- Hardened	Construction Person Hours - Non- Hardened	1,200 hours	1,400 hours	Increased time, need for further hardening measures
Smart Grid Performance	Smart Grid - Interruptions Avoided	300 incidents	350 incidents	Improvement, smart grid enhancing resilience
Equipment Comparison	Hardened Substation (Outages)	80,000	60,000	Improved performance, effective hardening measures
(Substation / Distribution)	Non-Hardened Substation (Outages)	86,667	125,333	Increased, monitor for further hardening
	Hardened Distribution (Outages)	106,667	155,333	Big increase, analysis needed
	Non-Hardened Distribution (Outages)	126,667	185,333	Increased vulnerability, consider reinforcement
	Restoration - 24 hrs	60% restored	55% restored	Slight delay, assess resource allocation
Events	Restoration - 48 hrs	85% restored	80% restored	Similar delay, possible need for more resources
	Restoration - 72 hrs	95% restored	92% restored	Minor delay, review efficiency
	Total Restoration Days	5 days	5.5 days	Slight increase, investigate specific challenges

Example on Comparative Metrics Application

X-Parameter Performance Ratio (X-PR) =
$$\frac{\text{Incidents Avoided}}{\text{Incidents Avoided + Sustained Incidents}}$$

> Take a circuit that has 200 poles and historically experiences 20% of them being damaged during significant storms.

Historical Pole Damage metric =
$$\frac{(200 - 40)}{(200 - 40) + (40)}$$
 = **0.8**

> Event 1 affects 25% of the poles Event 2 affects 5% of the poles.

Event 1 Pole Damage metric =
$$\frac{(200-50)}{(200-50)+(50)}$$
 = **0.75** Event 1 Pole Damage Ratio = $\frac{(0.75)}{(0.8)}$ = **0.94**

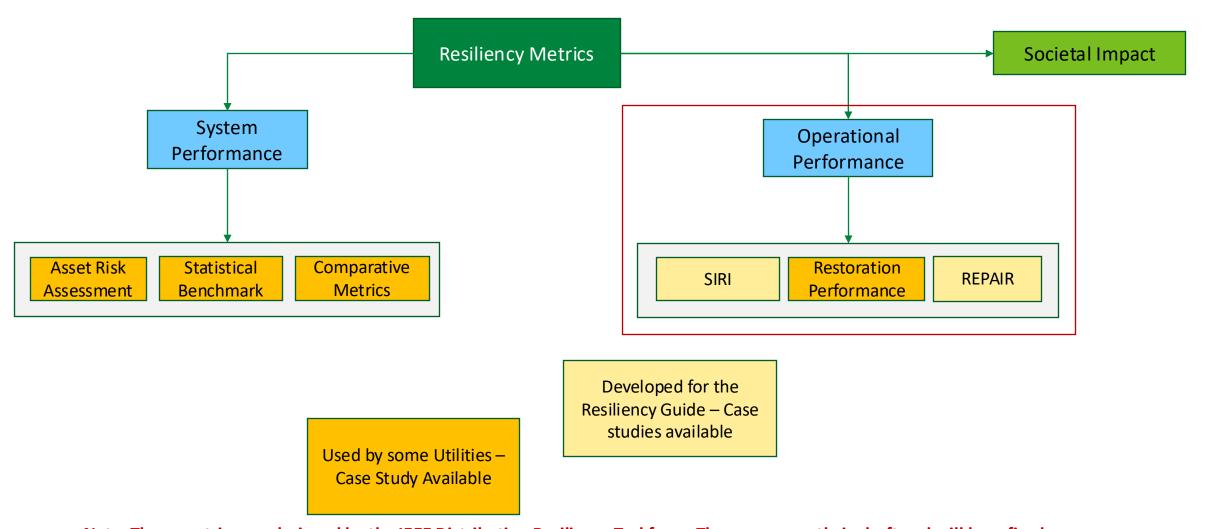

Event 2 Pole Damage metric =
$$\frac{(200-10)}{(200-10)+(10)}$$
 = **0.95** Event 2 Pole Damage Ratio = $\frac{(0.95)}{(0.8)}$ = **1.19**

Ratio less than unity indicates system performance less favorable than historical; whereas the event ratio greater than unity indicates performance favorable than historical benchmark.

A Comprehensive Suite of Metrics

Sustained Interruption Reduction Index (SIRI)

 $\mathsf{SIRI} = \frac{\mathsf{Avoided Sustained Customer Interruption (CI) \ by \ Automation}/\mathsf{Hardening}}{\mathsf{Avoided Sustained CI \ by \ Automation}/\mathsf{Hardening} + \mathsf{Sustained \ CI}}$

Aspect	Key Points
Perfect Resilience Scenario	Automation Performance Ratio of 1 signifies perfect resilience, ensuring uninterrupted service and high customer satisfaction.
Factors Influencing the Ratio	Automation Mechanisms: Impact on outage prevention. Sustained Outages: Causes like equipment failure or external disruptions.
Real-World Implications	Case Studies: Successful automation in outage prevention. Challenges: Areas where automation needs improvement.
Trends Over Time	Historical Analysis : Trends in Automation Performance Ratio and automation strategies. Continuous Improvement : Informing ongoing efforts.
Comparisons with Other Metrics	Comprehensive Resilience: Alignment with other metrics. Interconnected Nature: Holistic understanding of grid resilience.
Operational Considerations	Response Times: Speed of detection, decision-making, and execution. Adaptability: Handling different disturbances.
Scalability and Adaptability	Scalability Challenges: For larger grid systems. Technological Advances: Enhancing automation systems.
Practical Applications	Decision-Making Support: Helps in prioritizing investments. Customer Impact: Improved service reliability through outage prevention.

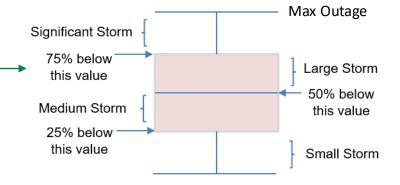

Restoration Performance

Calculation:

1) For each storm in a calendar year, calculate the ratio of customers without power for more than 12 hours and total customer interruptions (CI) including customers automatically restored (ACI) through smart switch operations (DA devices), community energy storage, and microgrids (does not include substation reclosing events) – measured in %

Storm Event: $x = \frac{\sum \text{Customers Without Power for More Than } \mathbf{Z} \text{ Hours}}{\text{Avoided Sustained CI by Automation}/\text{Hardening} + \text{Sustained CI}}$

- Based on number of interruptions (storm outages), categorize each storm event significant, large, medium, or small
- 3) Determine if X is greater than or equal to the threshold value (Y) for the category.
- 4) If X < Y, storm met expectations. If X >= Y, storm did not meet expectations

Threshold "Y" is calculated based on data analytics of small, medium, large, and significant size storm with 5 year moving average data. Details are explained in IEEE distribution resiliency guide.

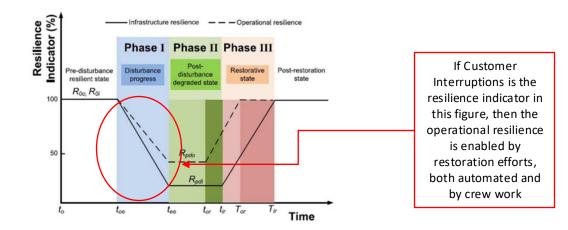

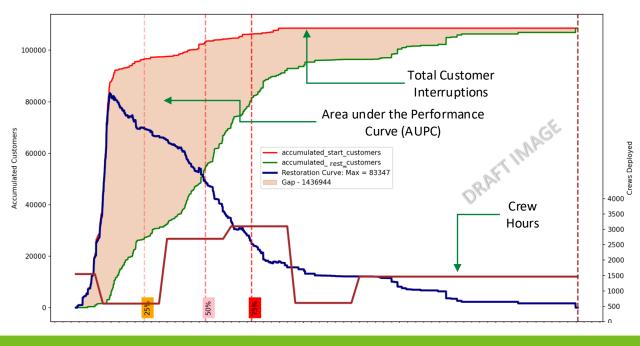

PES Power & Energy Society®

Factors:

- **Total Outages** Intensity of the storm [Noncontrollable]
- Max Customer Interruptions Indicator of crew efforts in curbing maximum degradation
 - Semi-Controllable better human performance, lower CI.
 - But for severe events where all outages happen at the head end of the chart, there will be significant lag in start of restoration by crews
- Area under the Restoration Curve Indicator tracking restoration efforts vs emerging outages. Smaller the area under the curve better restoration performance [Controllable – Better human performance, lower AUPC]
- Crew Hours Total hours spent on the field by crew [Controllable – Better human performance, lower crews needed for 100% restoration]
- Storm duration
- Full restore time Controllable but already captured by AUPC

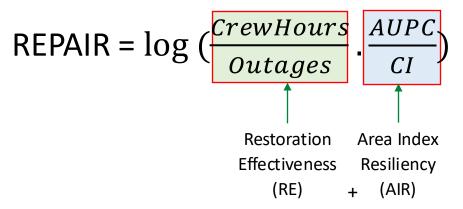

Sample Calculations for 9 storms

Wide range – compression required – Use Log scale

Insights:

- Lower crew
- Lower max customer Interruptions
- Lower AUPC

Outages(n)	Crew Hours	RE	AUPC	Cl	AIR	REPAIR
1,536	142,172	1.97	176,929	1,135,907	0.81	2.77
1,126	49,549	1.64	107,578	370,417	0.54	2.18
1,267	42,399	1.53	128,132	282,653	0.34	1.87
216	31,866	2.17	28,724	31,786	0.04	2.21
2,588	118,405	1.66	208,613	2,221,044	1.03	2.69
850	75,411	1.95	88,923	753,380	0.93	2.88
457	30,250	1.82	49,497	91,268	0.27	2.09
347	30,816	1.95	38,053	80,027	0.32	2.27
1,129	49,443	1.64	111,156	576,270	0.72	2.36

Average	2.37
Standard Deviation	0.32
Range	2.05 -2.69

Takeaways and Next Steps

- ComEd has been utilizing two metrics, restoration performance and Gray Sky day, since 2020.
- These metrics have allowed ComEd to concentrate on system enhancements and improvements in resiliency.
- Through the IEEE Distribution Resiliency Working Group, three other utilities have adopted the restoration performance and Gray Sky day metrics for their systems.
- 4 Utility Case study is included in the guide. 3 more are in the works.
- The final draft of the guide will be submitted for review and ballot at IEEE in 2025.

Regulators and stakeholders continue to use the IEEE 1366 metrics (the SAIDI sisters) to assess the impact of resilience events.
